1 Feasibility of a serverless distributed file system deployed on an existing set of desktop PCs

William J. Bolosky, John R. Douceur, David Ely, Marvin Theimer

June 2000 **ACM SIGMETRICS Performance Evaluation Review , Proceedings of the 2000 ACM SIGMETRICS international conference on Measurement and modeling of computer systems**, Volume 28 Issue 1

Full text available: pdf(946.00 KB) Additional Information: full citation, abstract, references, citings, index terms

We consider an architecture for a serverless distributed file system that does not assume mutual trust among the client computers. The system provides security, availability, and reliability by distributing multiple encrypted replicas of each file among the client machines. To assess the feasibility of deploying this system on an existing desktop infrastructure, we measure and analyze a large set of client machines in a commercial environment. In particular, we measure and report results on ...

Keywords: analytical modeling, availability, feasibility analysis, personal computer usage data, reliability, security, serverless distributed file system architecture, trust, workload characterization

2 Experimentation with bounded buffer synchronization

Steven Robbins

March 2000 **ACM SIGCSE Bulletin , Proceedings of the thirty-first SIGCSE technical symposium on Computer science education**, Volume 32 Issue 1

Full text available: pdf(774.78 KB) Additional Information: full citation, abstract, references, citings, index terms

Undergraduates are usually introduced to synchronization in operating systems through a discussion of classical problems such as reader-writer or producers-consumers. The traditional approach to teaching these topics is not effective in conveying to students how programs with incorrect synchronization actually behave. This paper introduces a simple probabilistic model for synchronization failure and shows how students can empirically study these issues. These activities are supported by a s ...

3 Comparative logical and physical modeling in two OODBMSs

Nancy K. Wiegand, Teresa M. Adams

September 1994 **ACM SIGAPP Applied Computing Review**, Volume 2 Issue 2

Full text available: pdf(553.69 KB) Additional Information: full citation, abstract, index terms

An application developer's perspective is used to compare modeling and storage in two

Object-Oriented Database Management Systems (OODBMSs): ODE (Object Database and Environment) and ObjectStore. Although both systems are based on the object-oriented language C++, differences exist in their OODBMS designs. Comparing the differences between these two systems provides insight into other possible designs or combinations of features that could be possible in an OODBMS. As part of this discussion, in ...

5 Some uses of { and }
Roger Hui
January 1987 **ACM SIGAPL APL Quote Quad , Proceedings of the international conference on APL: APL in transition**, Volume 17 Issue 4
Full text available: pdf(827.29 KB) Additional Information: full citation, abstract, references, citings, index terms

We believe that the design of APL was also affected in important respects by a number of procedures and circumstances. Firstly, from its inception APL has been developed by using it in a succession of areas. This emphasis on application clearly favors practicality and simplicity. The treatment of many different areas fostered generalization ... — Falkoff and Iverson, "The Design of APL"

6 Making B+- trees cache conscious in main memory
Jun Rao, Kenneth A. Ross
May 2000 **ACM SIGMOD Record , Proceedings of the 2000 ACM SIGMOD international conference on Management of data**, Volume 29 Issue 2
Full text available: pdf(406.75 KB) Additional Information: full citation, abstract, references, citings, index terms

Previous research has shown that cache behavior is important for main memory index structures. Cache conscious index structures such as Cache Sensitive Search Trees (CSS-Trees) perform lookups much faster than binary search and T-Trees. However, CSS-Trees are designed for decision support workloads with relatively static data. Although B+-Trees are more cache conscious than binary search and T-Trees, their utilization of a cache line is low since half of the space is used to store ...

7 Managing student workers: how to effectively schedule and supervise student workers in a dynamic environment
Michael L. Ringham
October 2000 **Proceedings of the 28th annual ACM SIGUCCS conference on User services: Building the future**
Full text available: pdf(820.09 KB) Additional Information: full citation, index terms

9 Realistic BGP traffic for test labs
Olaf Maennel, Anja Feldmann
August 2002 **ACM SIGCOMM Computer Communication Review , Proceedings of the 2002 conference on Applications, technologies, architectures, and protocols for computer communications**, Volume 32 Issue 4
Full text available: pdf(635.02 KB) Additional Information: full citation, abstract, references, citings, index terms

This paper examines the possibility of generating realistic routing tables of arbitrary size along with realistic BGP updates of arbitrary frequencies via an automated tool deployable in a small-scale test lab. Such a tool provides the necessary foundations to study such questions as: the limits of BGP scalability, the reasons behind routing instability, and the extent to which routing instability influences the forwarding performance of a router.We find that the answer is affirmative. In this p ...

Keywords: BGP, workload

10 Removing UNIX's stigma as a four-letter word: it's easy!
Linda J. Hutchison, Steven L. Kunz
December 1992 **Proceedings of the 20th annual ACM SIGUCCS conference on User services**
Full text available: pdf(612.82 KB) Additional Information: full citation, index terms

11 Reducing false sharing on shared memory multiprocessors through compile time data transformations
Tor E. Jeremiassen, Susan J. Eggers
August 1995 **ACM SIGPLAN Notices , Proceedings of the fifth ACM SIGPLAN symposium on Principles and practice of parallel programming**, Volume 30 Issue 8
Full text available: pdf(1.12 MB) Additional Information: full citation, abstract, references, citings, index terms

We have developed compiler algorithms that analyze explicitly parallel programs and restructure their shared data to reduce the number of false sharing misses. The algorithms analyze per-process shared data accesses, pinpoint the data structures that are susceptible to false sharing and choose an appropriate transformation to reduce it. The transformations either group data that is accessed by the same processor or separate individual data items that are shared.This paper evaluat ...

12 Fortran 8X discussion
Kent Paul Dolan
April 1988 **ACM SIGPLAN Fortran Forum**, Volume 7 Issue 1
Full text available: pdf(782.29 KB) Additional Information: full citation, abstract, index terms

ED NOTE: This item has a rather unusual format for Fortran Forum. It is an outgrowth of an E-mail discussion between Kent Paul Dolan of ODU and Presley Smith of Convex Computer Corp. Kent sent a note, and Presley sent a rather negative reply. What we now see is Presley's reply, somewhat edited by Kent and interspersed with Kent's counter-reply. After sending this message to Presley, Kent decided to post it on the USENET notes system. Carl Burch of Hewlett Packard picked it up and distributed it ...

14 An integrated Lisp programming environment
Harald Wertz
March 1983 **Proceedings of the symposium on High-level debugging**, Volume 8 , 18 Issue 4 , 8

Full text available: pdf(488.84 KB) Additional Information: full citation, abstract, references

We are currently implementing a system to help experienced programmers during the development, implementation and debugging of their programs. This system, built on top of a screen oriented structural editor, offers possibilities to attach descriptors to every portion of the program and to maintain - simultaneously - different versions of the program being written, including tentative hypothetical versions. It comprises a mecanism to maintain minimal consistency between modified parts of code, t ...

15 Building a layered database for design automation
Robert V. Zara, David R. Henke
June 1985 **Proceedings of the 22nd ACM/IEEE conference on Design automation**

Full text available: pdf(962.36 KB) Additional Information: full citation, abstract, references, citings, index terms

A layered approach is presented for the database of a distributed, interactive design automation system. Levels of abstraction are described from the point of view of the bottom-up designer. The controversy between the relational and network database formats is explored in the central abstraction: an object-oriented layer which attempts to select the advantages of each of these two formats while avoiding their respective disadvantages. This object-oriented approach treats each of ...

16 Automated extraction of SPICE circuit models from symbolic gate matrix layout with pruning
R. D. Freeman, S. M. Kang, C. G. Lin-Hendel, M. L. Newby
July 1986 **Proceedings of the 23rd ACM/IEEE conference on Design automation**

Full text available: pdf(1.18 MB) Additional Information: full citation, abstract, references, index terms

VLSI designers have made extensive use of SPICE simulation to analyze timing-critical circuits such as critical paths and clock distribution networks. Rigorous modeling of resistive and capacitive parasitics and transistors is required for these timing-critical circuits. Unfortunately the conventional circuit extractors have been unable to model wiring resistance and extracting the essential subcircuits, and therefore have required extensive manual editing. Manual editing is so complicated ...

17 Automatic layout for gate arrays with one layer of metal
Peter Robinson
June 1983 **Proceedings of the 20th conference on Design automation**

Full text available: pdf(635.70 KB) Additional Information: full citation, abstract, references, index terms

Gate arrays with only one layer of metal have some advantages-notably that they are easier to make than arrays with two or three layers of metal and are correspondingly cheaper. These are countered by the increased difficulty of layout, particularly if this is to be achieved automatically by a design automation system. This paper presents an automatic layout system providing placement and routing for the C-series of uncommitted logic arrays from Ferranti; although the techniques and program ...

Dick Bowman
December 1994 **ACM SIGAPL APL Quote Quad**, Volume 25 Issue 2
Full text available: pdf(474.06 KB) Additional Information: full citation, index terms

19 Chisel: a system for creating highly interactive screen layouts
G. Singh, M. Green
November 1989 **Proceedings of the 2nd annual ACM SIGGRAPH symposium on User interface software and technology**
Full text available: pdf(1.12 MB) Additional Information: full citation, abstract, references, citings, index terms

The UofA* User Interface Management System (UIMS) generates graphical user interfaces based on a high-level description of semantic commands supported by the application. A main part of the UIMS, called Chisel, generates the presentation component of interfaces. Chisel selects interaction techniques, determines their attributes, and places them on the screen of the display device. While doing so it is capable of considering device properties, end user's preferences, and ...

20 Windows and pop-up menus in application design
A. Smith
December 1987 **ACM SIGAPL APL Quote Quad , Proceedings of the international conference on APL**, Volume 18 Issue 2
Full text available: pdf(817.53 KB) Additional Information: full citation, abstract, citings, index terms

An increasing number of APLs support the 'Mac-like' interface, with its pioneering ideas of Windows, Icons, Mice and Pull-down Menus. Technically exciting these may be; what is lacking is any useful experience of handling these techniques in APL application design. The author has tackled the problem from the application end: a collection of functions has been evolved (written in APL*PLUS/PC) to provide simple windows and menus using text characters only. The major bene ...

Creating In-Line Objects Within an Integrated Editing Environment

Different types of objects are easily and automatically created in a single document by selecting the object type from a CREATE pop-down panel and then pointing to a location in the document. In a document-editing environment, it is desirable to create other than text objects without having to leave the document-editing session. Most editors that allow different object types, such as graphs, spreadsheets, etc., to exist concurrently with text require that these objects be created in a separate application window, placed in a buffer, and then pasted into the document at the desired location. To use these editors, one must have a technical understanding of more than one application, and must learn a detailed method in order to create a document-containing text, graphics and spreadsheets. By providing a method within an application to allow an operator to create text, graphics and spreadsheets dynamically, the editor has given the operator a mechanism to design and develop highly complex, compound documents easily and effortlessly. To create any type of object, the operator first selects a CREATE action from the system command bar. A pop-down panel is present with an entry for each object that can be created. The operator selects an object and then a location. An icon representation of the object is placed at the location. The operator then creates the object data next to the icon. For text, this implies keying in character data. For graphics, this implies selecting sub-objects from an addendum to the CREATE pop-down. In the later case, the sub-objects such as circles, rectangles, free hand art forms, etc., are still dynamically defined in-line. For a spreadsheet, the operator defines the table size, and the rows and columns appear with each cell ready for input. In the above the overhead of separate application loading and window support is avoided, and the operator editing process is simplified.
